

During this portfolio analysis project, I developed strong analytical and technical skills relevant to financial analysis. I worked extensively with Excel to organize financial data, create tables and charts, and apply descriptive statistical measures such as mean return, variance, and standard deviation. I also applied statistical techniques including Chi-square tests, F-tests, and regression analysis to evaluate risk and compare the performance of two companies using risk-adjusted return metrics. Additionally, I improved my ability to interpret quantitative results and present them clearly. I also gained experience using GitHub for file management and project organization, which strengthened my skills in managing analytical projects and working with structured data.
